No part of this manual may be reproduced in any form or by any means (including electronic storage and retrieval or translation into a foreign language) without prior agreement and written consent from Agilent Technologies Inc. as governed by United States and international copyright laws.

Notice
The material contained in this document is subject to change without notice. Agilent Technologies makes no warranty of any kind with regard to this material, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. Agilent Technologies shall not be liable for errors contained herein or for incidental or consequential damages in connection with the furnishing, performance, or use of this material.

Warranty
This Agilent Technologies product has a warranty against defects in material and workmanship for a period of three years from date of shipment. During the warranty period, Agilent Technologies will, at its option, either repair or replace products that prove to be defective. For warranty service or repair, this product must be returned to a service facility designated by Agilent Technologies. The Buyer shall pay Agilent Technologies round-trip travel expenses. For products returned to Agilent Technologies for warranty service, the Buyer shall prepay shipping charges to Agilent Technologies and Agilent Technologies shall pay shipping charges to return the product to the Buyer. However, the Buyer shall pay all shipping charges, duties and taxes for products returned to Agilent Technologies from another country.
Agilent Technologies warrants that its software and firmware designated by Agilent Technologies for use with an instrument will execute its programming instructions when properly installed on that instrument. Agilent Technologies does not warrant that the operation of the instrument software, or firmware, will be uninterrupted or error free.

**Limitation of Warranty**

The foregoing warranty shall not apply to defects resulting from improper or inadequate maintenance by the Buyer, Buyer-supplied software or interfacing, unauthorized modification or misuse, operation outside of the environmental specifications for the product, or improper site preparation or maintenance. No other warranty is expressed or implied. Agilent Technologies specifically disclaims the implied warranties of merchantability and fitness for a particular purpose.

**Exclusive Remedies**

The remedies supplied are the Buyer's sole and exclusive remedies. Agilent Technologies shall not be liable for any direct, indirect, special, incidental, or consequential damages, whether based on contract, tort or any other legal theory.

**Certification**

Agilent Technologies certifies that this product met its published specifications at the time of shipment. Agilent Technologies further certifies that its calibration measurements are traceable to the United States Institute of Standards and Technology, to the extent allowed by the Institute's calibrating facility, and to the calibration facilities of other International Standards Organization members.

**Services and Support**

Any adjustment, maintenance, or repair of this product must be performed by qualified personnel. Contact your customer engineer through your local Agilent Technologies Service Center. You can find a list of local service representatives on the Web at:

http://www.agilent.com/Service/English/index.html
Safety Summary

The following general safety precautions must be observed during all phases of operation of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Agilent Technologies Inc. assumes no liability for the customer's failure to comply with these requirements.

General
This product is a Safety Class 1 instrument (provided with a protective earth terminal). The protective features of this product may be impaired if it is used in a manner not specified in the operation instructions.

All Light Emitting Diodes (LEDs) used in this product are Class 1 LEDs as per IEC 60825-1.

Environmental Conditions
This instrument is intended for indoor use in an installation category II, pollution degree 2 environment. It is designed to operate at a maximum relative humidity of 95% and at altitudes of up to 2000 meters. Refer to the specifications tables for the ac mains voltage requirements and ambient operating temperature range.

Before Applying Power
Verify that the product is set to match the available line voltage, the correct fuse is installed, and all safety precautions are taken. Note the instrument's external markings described under “Safety Symbols” on page 8.
Safety Summary

**Ground the Instrument**
To minimize shock hazard, the instrument chassis and cover must be connected to an electrical protective earth ground. The instrument must be connected to the ac power mains through a grounded power cable, with the ground wire firmly connected to an electrical ground (safety ground) at the power outlet. Any interruption of the protective (grounding) conductor or disconnection of the protective earth terminal will cause a potential shock hazard that could result in personal injury.

**Fuses**
Only fuses with the required rated current, voltage, and specified type (normal blow, time delay, etc.) should be used. Do not use repaired fuses or short-circuited fuse holders. To do so could cause a shock or fire hazard.

**Do Not Operate in an Explosive Atmosphere**
Do not operate the instrument in the presence of flammable gases or fumes.

**Do Not Remove the Instrument Cover**
Operating personnel must not remove instrument covers. Component replacement and internal adjustments must be made only by qualified service personnel.

Instruments that appear damaged or defective should be made inoperative and secured against unintended operation until they can be repaired by qualified service personnel.
Safety Summary

Safety Symbols

⚠️ Caution (refer to accompanying documents)

Grounding symbol

Protective earth (ground) terminal

In the manuals:

**WARNING**

The WARNING sign denotes a hazard. It calls attention to a procedure, practice, or the like, which, if not correctly performed or adhered to, could result in personal injury. Do not proceed beyond a WARNING sign until the indicated conditions are fully understood and met.

**CAUTION**

The CAUTION sign denotes a hazard. It calls attention to an operating procedure, or the like, which, if not correctly performed or adhered to, could result in damage to or destruction of part or all of the product. Do not proceed beyond a CAUTION sign until the indicated conditions are fully understood and met.
About this Book

This quick start guide helps you to quickly get familiar with the features and the user interface of the Agilent 81130A Pulse Generator.

Chapter 1 “Introducing the Agilent 81130A Pulse and Data Generator” on page 15 gives a general overview of the Agilent 81130A, its features, the user interface, and the steps required for operating the instrument.

Chapter 2 “Getting Started” on page 31 gives the setup information for some real-world signal examples, which can easily be used by varying only some parameter values.

Chapter 3 “Using the Agilent 81130A” on page 59 provides complete information on the user interface screens.

Installation and maintenance are described in Appendix A “Installation & Maintenance” on page 99.

For specifications and information on operating the instrument by means of remote control, please refer to the Reference Guide, p/n 81130-91021.
## Conventions Used in this Book

This book uses certain conventions to indicate elements of the Agilent 81130A's user interface. The following table shows some examples:

<table>

Introducing the Agilent 81130A Pulse and Data Generator

The purpose of the introduction chapter is to give a general overview of the Agilent 81130A.

The main features and use models are described in “What you can do with the Agilent 81130A” on page 16.

Operating the instrument via the front panel user interface is described in “The Front Panel” on page 18 and “Operating the Agilent 81130A” on page 20.

“Help is Available” on page 29 shortly introduces the Agilent 81130A’s on-line help system.

Finally, “The Rear Panel” on page 30 takes a look at the back of the Agilent 81130A.
What you can do with the Agilent 81130A

This section introduces the basic features and use models of the Agilent 81130A Pulse Generator.

**Basic Features**

The Agilent 81130A is a pulse and data generator with one or two output channels. It is capable of generating all standard pulses, bursts, and patterns of pulses needed to test current logic technologies (for example, TTL, CMOS, ECL, PECL) and other digital designs up to 400 MHz/3.8V or 660 MHz/2.5V, depending on the installed output module(s).

The instrument features **precision timing**, providing highest edge placement accuracy and accurate delay and deskew even at maximum output frequency. This contributes to reliable measurements and more accurate and confident characterizations of the device under test (DUT).

The instrument uses an accurate and stable **internal PLL oscillator**. For even more accuracy, it can be connected to an **external frequency reference**.

For programming complex **data patterns**, such as communication packages, 64 kbit memory are available to store individual patterns. Each pattern can consist of up to four segments. Loops can be programmed over single segments or groups of consecutive segments. The segments can include **pseudo-randomly generated data**.

If the Agilent 81130A is equipped with two output modules, the output channels can be used separately or be **added** digitally to form complex signals.

Complete signal setups can be stored locally (5 internal non-volatile registers available) or on a **memory card**.
Benchtop Testing

The Agilent 81130A features a graphic display showing all pulse parameters at a glance. The cursor keys and the modify knob allow fast and simple operation.

The user interface is designed to minimize the time invested in getting familiar with the instrument. After familiarization, the instrument supports quick setups of signals. This leaves you free to concentrate on the measurement task and testing of the DUT.

Automated Testing

The Agilent 81130A features an GP-IB/SCPI-conform command structure for all features. Using this programming interface, the instrument can be easily integrated into all phases of test system development such as planning rack integration and test program generation.

Programs designed for the Agilent 81130A are compatible with all other models of the Agilent 81100 family.

NOTE

For a command reference list, please refer to the Reference Guide, part number 81130-91021.

Upgrade Capability

It is possible to upgrade the instrument with a second channel if only one channel has been ordered originally. There are two types of output modules available for the Agilent 81130A. You can only use one type of output module within one instrument.

<table>
<thead>
<tr>
<th>Output Module</th>

</tr>
</tbody>
</table>
Introducing the Agilent 81130A Pulse and Data Generator
The Front Panel

The Front Panel

When used for benchtop testing, the instrument is mainly operated from the front panel.

The **front panel switch** is used to switch on and off the instrument.

**NOTE**

When the front panel switch is off, the instrument is in “standby” mode. The instrument is disconnected from the AC line power *only* by disconnecting the power cord.

The four keys below the display are the **softkeys** (software-controlled keys). The current function of each softkey is indicated in the corresponding box on the display.

Pressing the **MORE** key changes the softkey layout.

The other keys (**special function keys**, **data entry keys**, **cursor keys**) and the **rotary knob** are used to select and modify parameters when operating the instrument (see “Operating the Agilent 81130A” on page 20).
Introducing the Agilent 81130A Pulse and Data Generator
The Front Panel

The major inputs and outputs of the instrument are available at the front panel:

- The external input (EXT INPUT) can be used to connect an external arming source (started or gated modes). For details, please refer to “The Mode/Trigger Screen” on page 60.
- The clock reference input (CLK/REF INPUT) can be used to connect either an external clock signal or a reference signal for the internal PLL (see “Pulse Period Source” on page 94 and “PLL Reference” on page 94).
- The trigger signal (TRIGGER OUT) marks the start of the pulse period or of parts of a pattern (see “The Mode/Trigger Screen” on page 60). You can set the output levels according to the used technology (TTL, ECL, PECL) or enter test-specific values (see “The Trigger-Level Screen” on page 87).
- The OUTPUT connectors provide the signal output (normal and inverted), the indicators show the current state of the output (on or off).

**NOTE**

For information on the use of the memory card slot, refer to “The Memory Card Screen” on page 89.
Operating the Agilent 81130A

This section guides you through the first steps when operating the Agilent 81130A via the user interface.

NOTE

For information on operating the Agilent 81130A via remote control, please refer to the Reference Guide, part number 81130-91021.

Switching On the Instrument

After switching on the instrument the display indicates that the instrument selftest is running. This can take several seconds to complete.

If the selftest fails, you see a flashing E at the bottom of the screen. Press the HELP key to see a list of the selftest error messages. Use the knob or the cursor keys to scroll through the list if necessary.

To return to normal operation press HELP again. Note that the selftest error messages are removed from the error queue after this.
The Basic Screens

The major parameters for pulse generation can be set up in 3 screens. For setting up patterns there are two more basic screens.

The **Mode/Trigger screen** allows you to set the fundamental operating and trigger modes with respect to the signal required.

In this screen, you can set up the signal to be gated, started or continuous, and to be a pulse stream, a burst (several pulses followed by a pause) or a pattern.

In the lower section you can specify the trigger source and control the trigger output (in started and in gated mode).
Introducing the Agilent 81130A Pulse and Data Generator
Operating the Agilent 81130A

The **Timing screen** and the **Levels screen** allow you to specify timing and level parameters for the signals to be generated.

Press the **TIMING** or **LEVELS** softkey to access these screens.

In the Timing screen you can set up the clock frequency and, for output 1 and 2, the timing for the signals (delay, pulse width, duty cycle, ...).

The Levels screen allows you to specify the level parameters for the signals to be generated. You can select between preset values of different technologies and/or adjust values according to individual requirements. Set the values in terms of high/low level or offset/amplitude. If the Agilent 81130A is equipped with two output modules, the channels can be set as separate outputs or to be digitally added.

Pressing **SHIFT + MORE (GRAPH)** when the Timing or the Levels screen is displayed, toggles between the textual display and a graphical representation of the parameters.

In both screens, you can switch on and off the outputs. Their status (ON or OFF) is indicated on screen and by an LED next to the output connector.
The **Pattern screen** allows you to compose a pattern sequence consisting of up to 4 segments. You can specify the length of each individual segment and then compose the sequence by specifying a re-entrance point (where the instrument resumes after the end of the sequence) and/or a loop over consecutive segments.

To set up the data of a segment, you call the **segment editor** by selecting the segment to be edited and pressing the ENTER key.

Per channel you can select from different predefined data formats (such as high, or low, or pseudo-random data segment), you can enter data by using block editing functions, and you can enter the data bit by bit.
# Adjusting Parameters

Adjusting parameters within a screen, requires two steps:
- selecting the parameter
- adjusting its value

Some parameters allow different formats of their values. For example, the pulse width can be displayed and entered as an absolute value, as duty cycle (percentage of the period), or as the delay of the trailing edge.

The following sections show the standard procedure for adjusting parameters, and list some features useful for the advanced user.

## Standard Procedure

To experience the standard procedure for adjusting parameters, consider the following example where the duty cycle is set to 50%.

1. Press the **TIMING** softkey to access the Timing screen.
2. Use the cursor keys to select the **WIDTH** parameter.

<table>
<thead>
<tr>
<th>Selection</th>
<th>Modify/Enter Area</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 OFF OFF</td>
<td>Per 1.000 µs OFF</td>
</tr>
<tr>
<td>Delay 100.0ns</td>
<td>Width 100.0ns</td>
</tr>
<tr>
<td>DutyCycle TrailDel</td>
<td></td>
</tr>
</tbody>
</table>

The available formats for the pulse width parameter are displayed in the Modify/Enter area.
Introducing the Agilent 81130A Pulse and Data Generator
Operating the Agilent 81130A

When changing the parameter format, the instrument automatically recalculates the value.

3. Turn the knob to select DUTYCYCLE. The selected setting is indicated by an “*”.

4. Move the cursor to the right to select the duty cycle value.

5. Use the data entry keys or the knob to enter the required value: 50.

6. Press the ENTER key to confirm your selection.

If you need to specify a unit for a parameter, simply press the appropriate unit key (NANO, MICRO/MEGA, MILLI/KILO) instead of the ENTER key.

With this small example, you have learned the basic steps required for adjusting parameters. For a complete reference of parameters and formats available in the individual screens, refer to Chapter 3 “Using the Agilent 81130A” on page 59.
Advanced Procedures

The following features can be used to make operation more comfortable.

- **Selecting parameters**
  
  Most keys of the front panel have an additional function. The **SHIFT** key provides fast access to the additional functions of the data entry keys and the special function keys.
  
  For example, it is possible to quickly access the pulse width parameter by pressing **SHIFT** + 6 (**WIDTH**). The entry focus will be positioned on the corresponding editing field.

- **Changing the step size**
  
  When modifying a value in the Modify/Enter area, pressing the **SHIFT** key followed by cursor left/right moves the cursor to a different digit in the displayed number.
  
  Thus, you can change the step size for parameter change before you vary the value either with the up/down cursor keys or the knob.

- **Overprogramming**
  
  Pressing the **SHIFT** key while turning the knob, it is possible to exceed specified parameter ranges to utilize the instrument to its limits.

**NOTE**

Proper operation of the instrument outside of the specified ranges is not guaranteed. It is recommended to have the output switched on when overprogramming to have the internal error check system activated. This error check system warns you about impossible settings.
Introducing the Agilent 81130A Pulse and Data Generator
Operating the Agilent 81130A

Switching the Outputs On and Off

When you switch the instrument on, the outputs and inverted outputs are switched off to protect the device under test. The LED indicator next to the connector indicates the output state.

For example, to switch output 1 on or off

- either press \texttt{SHIFT + 0 (ON/OFF1)},
- or move the cursor to the ON/OFF parameter in the Timing or Levels screen and select the appropriate value by turning the knob.

To switch on or off output 2 and/or the inverted outputs, proceed in the same way. You can use the following short cuts:

<table>
<thead>
<tr>
<th>Short Cut</th>
<th>Output</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{SHIFT + 0 (ON/OFF1)}</td>
<td>Normal Out 1</td>
</tr>
<tr>
<td>\texttt{SHIFT + . (decimal point) (ON/OFF1)}</td>
<td>Inverted Out 1</td>
</tr>
<tr>
<td>\texttt{SHIFT +/- (ON/OFF2)}</td>
<td>Normal Out 2</td>
</tr>
<tr>
<td>\texttt{SHIFT + ENTER (ON/OFF2)}</td>
<td>Inverted Out 2</td>
</tr>
</tbody>
</table>

Using the Special Function Keys

The instrument provides the following special function keys:

- The \texttt{MAN} key can be used to run and to stop the instrument, and, in triggered or gated mode, to manually arm and/or trigger the instrument if there is no other source available (see “The Mode/Trigger Screen” on page 60).

- The \texttt{STORE} key can be used to store/recall to/from 1 to 4 individual settings in the instrument memory.

  In the internal memory location 0 there is a default setting stored. Pressing \texttt{SHIFT + STORE (RECALL)} and selecting 0 resets the instrument to the default setting.
Introducing the Agilent 81130A Pulse and Data Generator
Operating the Agilent 81130A

- The **SHIFT** key provides fast access to additional functions. When the front panel controls are locked in remote control, pressing the **SHIFT** key unlocks the front panel controls.

- The **HELP** key provides access to the instrument’s on-line help or in warning or error state, access to Warning/Error Report screen. Pressing **SHIFT + HELP (AUTOSET)** sets the instrument to a valid setting based on the current period setting.
Help is Available

Whenever you are in doubt or the instrument signals warnings or errors, press the HELP key.

Help

If there are no warnings or errors pending, pressing the HELP key displays information on the currently selected parameter, the parameter help. More information is available within the help system:

- **Parameter Help**
  The help information gives a short description of the parameter or setting options and the corresponding SCPI command(s) syntax for programming the parameter or setting.
  If there is more than one screen available (indicated by small arrows), use the knob or the cursor keys to scroll through the help information.
  To access parameter help from other screens of the help system, press the ON FIELD softkey.

- **Concept Help**
  Pressing the CONCEPT softkey within the help system displays a short description of the instrument.

- **Serial Numbers and Software Revision**
  Pressing the SERIAL # softkey within the help system displays information on serial numbers and software revision codes of the instrument.

Warnings and Errors

If there are warnings or errors pending (indicated by a flushing W or E), pressing the HELP key displays a list of the current messages. Using the ERROR QU and WARNING softkeys, you can toggle between both lists. For more information on warnings and errors, see “Warnings and Errors” on page 96.

Exit Help

To exit from the help system, press the HELP key again, or press the EXIT HELP softkey.
Introducing the Agilent 81130A Pulse and Data Generator

The Rear Panel

The rear panel always provides two connectors:

- The external input (EXT INPUT) can be used to connect an external arming source (started or gated modes).
- The input connector for external clock or PLL reference (CLOCK/REF INPUT) can be used if a higher frequency accuracy is required.
- The GP-IB connector providing the interface for remote control.

The following figure shows the rear panel view with the option UN2.

With option UN2 the major inputs and outputs of the instrument (as described in “The Front Panel” on page 18) are available at the rear panel:

- external input (EXT INPUT)
- clock/reference input (CLK/REF INPUT)
- trigger signal (TRIGGER OUT)
- signal output (OUTPUT)
The intention of this chapter is to give the necessary steps to set up generic signals for first-time users of the Agilent 81130A.

This chapter provides examples for the following types of signals:

- “Setting Up a Clock Signal” on page 32
- “Setting Up a Burst Signal” on page 37
- “Setting Up a Serial Data Stream” on page 41
- “Setting Up an Edge-Displacement Signal” on page 46
- “Setting Up a Serial Data Sequence” on page 51

At the end of each example, the required set of device commands is listed to provide programming examples. For further information on the commands and a complete command reference please refer to the Reference Guide, p/n 81130-91021.

The examples are intended to be performed one after the other. Therefore, the first example provides the most detailed instructions, while the other examples are described on a higher level.
Setting Up a Clock Signal

**Task**
Set up a continuous clock signal with 50 MHz frequency, a duty cycle of 50 %, a high level of 2.5 V and a low level of 0 V.

**Instructions**
To set the operating mode and trigger mode as required:

1. Reset all parameters and modes by pressing \texttt{SHIFT + STORE (RECALL) + 0}.
2. Press the \texttt{MODE/TRG} softkey to enter the Mode/Trigger screen. Trigger mode \texttt{CONTINUOUS} and operating mode \texttt{PULSES} are selected by default.
To set the **timing parameters** as required:

1. Press the TIMING softkey to enter the Timing screen.
2. Press **SHIFT + 0 (ON/OFF1)**. This turns on the Output 1 and activates the internal error check to detect parameter conflicts.
3. Move the entry focus to **PER** and turn the knob to select **FREQUENCY**.
4. Move the entry focus to the right (to the frequency entry field) and enter a value of 50 MHz by pressing **5 + 0 + MICRO/MEGA**. A warning is displayed, indicating a potential conflict in your settings. The conflict will be solved in the next steps.
5. If you want to view the warning message, press the **HELP** key. Return by pressing the **HELP** key again.
6. Move the entry focus down left to **WIDTH** of output 1 and select **DUTYCYC**.
7. Move the entry focus to the right and enter 50 % by typing **5 + 0 + ENTER**.

---

**Settings:**

- **1 ON**
  - **Freq 50.00MHz**
- **2 MODIFY**
  - **50.0 %**
  - **50.0ns**

**Options:**

- **MODE/TRG**
- **TIMING**
- **LEVELS**
- **PATTERN**
Press \text{SHIFT} + \text{MORE (GRAPH)} or the \text{TIMING} softkey to see a preview of your signal.

You can modify the parameter displayed in the Modify/Enter area, and immediately check how your changes affect the signal. Use the cursor keys to switch to another parameter.

Press \text{SHIFT} + \text{MORE (GRAPH)} or the \text{TIMING} softkey to return to the textual screen.

To set the \textit{level parameters} as required:

1. Press the \text{LEVELS} softkey to enter the Levels screen.
2. Move the entry focus to \text{OFFSET/AMPLIT} in the output 1 column and turn the knob to select \text{HIGH-LOW}.
3. Move the entry focus to the \text{LOW} entry field, enter 0 and press the \text{ENTER} key. In the same way, enter 2.5 \text{V} for the high level.
NOTE

There is also a graphical screen available for the level parameters.

Here is the signal as displayed on an Agilent 54810A Infinium oscilloscope. Use the generator’s TRIGGER OUT to trigger the scope.
Getting Started
Setting Up a Clock Signal

Programming Example
If you want to include this clock signal in your GP-IB program, use the following command lines. The comment lines starting with a # are not required.

# Reset the instrument to start from a defined, default status.
*RST

# Switch off the automatic display update to increase programming speed.
:DISPlay OFF

# Internal PLL has to be set as period source.

# Set the frequency to 50 MHz and the duty cycle to 50 %
:FREQuency 50 MHZ
:PULSe:DCYCle 50

# Set the high level to 2.5 Volts, the low level to 0.0 Volts.
:VOLTage:HIGH 2.5V
:VOLTage:LOW 0V

# Enable the output.
:OUTPut ON
Setting Up a Burst Signal

Task
Set up a burst signal with a burst repetition of 4 clocks. Each burst consists of two pulses at a period of 100 ns. The pulse width is 25 ns. The levels are 2 Vpp amplitude and 0 V offset. On the second channel the clock reference is generated. The signals are issued while the MAN key is pressed.

Instructions
To set the operating mode and trigger mode as required:

1. Reset all parameters and modes by pressing \texttt{SHIFT + STORE + 0}.
2. Press the MODE/TRG softkey to enter the Mode/Trigger screen.
3. Move the entry focus to CONTINUOUS and turn the knob to select GATED.
4. Move to PULSES and select BURST OF.
5. Move to PULSES OUT 1 and select 2.
Getting Started
Setting Up a Burst Signal

7 Move to BURST PERIOD and select 4 clocks.
8 Move to GATED BY and select MAN KEY.
9 Move right and select HIGHLEVEL.

<table>
<thead>
<tr>
<th>GATED BURST of</th>
<th>RUN</th>
<th>MODIFY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pulses Out 1:</td>
<td>2</td>
<td>*HighLevel</td>
</tr>
<tr>
<td>Out2:</td>
<td>4</td>
<td>LowLevel</td>
</tr>
<tr>
<td>Burst Period:</td>
<td>4</td>
<td></td>
</tr>
<tr>
<td>Gated by:</td>
<td>MAN Key</td>
<td></td>
</tr>
</tbody>
</table>

To set the timing parameters as required:
1 Press the TIMING softkey to enter the Timing menu.
2 Switch on both outputs.
3 Enter a pulse period of 100 NS.
   A warning is shown, which you may ignore because the parameter conflict will be solved in the next steps.
4 In the output 1 column, enter a WIDTH of 25 NS.
5 In the output 2 column, move to WIDTH, select DUTYCYCLE, and enter a value of 50%.
To set the **level parameters** as required:

1. Press the LEVELS softkey to enter the Levels menu.
2. Enter an amplitude of 2.00 V for both outputs.

The following figure shows the signals as displayed on the Agilent 54810A Infinium Oscilloscope if the MAN key is pressed. Use the generator’s TRIGGER OUT to trigger the scope.
Getting Started
Setting Up a Burst Signal

Programming example

If you want to include this burst signal in your GP-IB program use the following command lines. The comment lines starting with a # are not required.

# Reset the instrument to start from a defined, default status.
*RST

# Switch off the automatic display update to increase programming # speed.
:DISPlay OFF

:OUTPut2 ON
Getting Started
Setting Up a Serial Data Stream

Setting Up a Serial Data Stream

Task
Set up a 24 bit long pattern with NRZ data output format, 80 MBit/s, and ECL output level.

Instructions
To set the operating mode and trigger mode as required:

1. Reset all parameters and modes by pressing SHIFT + STORE + 0.
2. Press the MODE/TRG softkey to enter the Mode/Trigger screen.
3. Move to PULSES and select PATTERN.
4. Move to the PULSES OUT 1 entry field and select NRZ.
5. Set TRIGGER OUTPUT AT: to SEG1 START.

- CONTINUOUS PATTERN of
  Pulses Out 1: NRZ  Out 2: RZ
  PRBS Polynom: 2^7-1
- Clock
  *Segm1 Start
  Segment2
  Segment3
- Trigger Output at: Segm1 Start

- MODE/TRG  |  TIMING  |  LEVELS  |  PATTERN

41
To set the **timing parameters** as required:

1. Press the **TIMING** softkey to enter the Timing menu.
2. Switch on the Output 1.
3. Enter a frequency of 80 MHz.

<table>
<thead>
<tr>
<th></th>
<th>ON</th>
<th>Freq</th>
<th>80.00MHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delay</td>
<td>0ps</td>
<td>Width</td>
<td>------</td>
</tr>
<tr>
<td>1</td>
<td>OFF</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>OFF</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NOTE**

You cannot enter a pulse width because of the NRZ setting. This is indicated by the dashes in the **Width** entry field.

To set the **level parameters** as required:

1. Press the **LEVELS** softkey to enter the Level menu.
2. In the output 1 column, move the entry focus to OFFSET/AMPLIT and select **SET ECL**.
Getting Started
Setting Up a Serial Data Stream

To set up the data pattern as required:

1. Press the PATTERN softkey to enter the Pattern menu.
2. Move the entry focus to the length entry of segment 1 and enter 24.
3. To start editing the data for the pattern, select 1 in the Segment column and press the ENTER key.
4. Move to the first data of channel 1, as shown in the figure:

   ![Segment 1 Table]

<table>
<thead>
<tr>
<th>Segment 1</th>
<th>UPDATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>1</td>
</tr>
<tr>

</tr>
<tr>
<td>CH2 Data</td>
<td>10000000</td>
</tr>
<tr>
<td>Both</td>
<td>12000000</td>
</tr>
</tbody>
</table>

5. Enter the following pattern using the 0 and 1 keys:
   11100110011001001010010.

**NOTE**
You can use the knob to scroll through the data of the segment.
The following figure shows the signals as displayed on the Agilent 54810A Infinium Oscilloscope. Use the generator’s TRIGGER OUT to trigger the scope.
Getting Started
Setting Up a Serial Data Stream

Programming example

If you want to include this data stream signal in your GP-IB program use the following command lines. The comment lines starting with a # are not required.

# Reset the instrument to start from a defined, default status.
*RST

# Switch off the automatic display update to increase programming speed.
:DISPLAY OFF

# Enable pattern mode and set data format of channel 1 to NRZ
:DIGital:PATTern:STATe ON
:DIGital:SIGNal:FORMat NRZ

# Set data pattern of segment 1, channel 1. The leading two digits "#0" are control information. The data pattern starts at the third digit.
:DIGital:PATTern:SEGment1:DATA1 #011100111001100100101001

# Set frequency to 80 MHz and levels to ECL levels.
:FREQency 80MHz
:VOLTage1:HIGH -0.8V
:VOLTage1:LOW -2V

# Enable the output.
:OUTPut ON
Setting Up an Edge-Displacement Signal

**Task**
Set up a continuous signal with one distorted pulse. The two channels are added with NRZ at both outputs. The high level is 1 V, low level is 0 V. The delay of output 2 is 30 ns and the bit frequency is 30 MHz.

**NOTE**
For this example, both outputs and the channel addition feature are required. Therefore, this type of signal can only be performed with a Agilent 81130A with two output modules (Agilent 81131A or Agilent 81132A).
Instructions

To set the **operating mode and trigger mode** as required:

1. Reset all parameters and modes by pressing \texttt{SHIFT + STORE + 0}.
2. Press the \texttt{MODE/TRG} softkey to enter the Mode/Trigger screen.
3. Move the entry focus to \texttt{PULSES} and select \texttt{PATTERN}.
4. Set \texttt{PULSES OUT 1} and \texttt{OUT 2} to \texttt{NRZ}.

To set the **timing parameters** as required:

1. Press the \texttt{TIMING} softkey to enter the Timing menu.
2. Enter a frequency of 30 MHz.
3. Enter a \texttt{DELAY} of 30 NS for Output 2.

**NOTE**

You cannot enter a pulse width because of the \texttt{NRZ} setting. This is indicated by the dashes in the \texttt{WIDTH} entry field.
Getting Started

Setting Up an Edge-Displacement Signal

To set the **data pattern** as required:
1. Press the PATTERN softkey to enter the Pattern menu.
2. Enter a LENGTH of 8 for Segment 1.
3. Move the entry focus to left and press the ENTER key to edit Segment 1.
4. Enter the pattern 10100010 for Channel 1.
5. Enter the pattern 00001000 for Channel 2.

<table>
<thead>
<tr>
<th>Segment 1</th>
<th>UPDATE</th>
<th>Address</th>
<th>8</th>
<th>Length</th>
<th>8</th>

</tr>
<tr>
<td>Both</td>
<td>2 0 1</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To set the **level parameters** as required:
1. Press the LEVELS softkey to enter the Level menu.
2. Switch on both outputs.
3. Change **SEPARATE OUTPUTS** to DIG. ADD AT OUT 1.
4. Set **HIGHLEVEL** to 1 V and **LOWLEVEL** to 0 V for output 1.
5. Set **HIGHLEVEL** to 0.5 V and **LOWLEVEL** to –0.5 V for output 2.
Getting Started
Setting Up an Edge-Displacement Signal

The following figure shows the signal as displayed on the Agilent 54810A Infinium Oscilloscope. Use the generator’s channel 2 to trigger the scope.
Getting Started

Setting Up an Edge-Displacement Signal

Programming example

If you want to include this edge-displacement signal in your GP-IB program, use the following command lines. The comment lines starting with a # are not required.

# Reset the instrument to start from a defined, default status.
*RST

# Switch off the automatic display update to increase programming speed.
:DISPLAY OFF

# Set the data format to NRZ for both channels, enter the patterns, and enable pattern mode.

# Enable the output.
:OUTPut1 ON
:OUTPut2 ON
Setting Up a Serial Data Sequence

Task
Set up a serial data sequence at 166.7 MHz, consisting of a header, simulated payload data accompanied by a clock on output 2, and a trailing pause.

NOTE
For this example, both outputs are required. Therefore, this type of signal can only be performed with a Agilent 81130A with two output modules (Agilent 81131A or Agilent 81132A).
Getting Started
Setting Up a Serial Data Sequence

Instructions

To set the **operating mode and trigger mode** as required:

1. Reset all parameters and modes by pressing \texttt{SHIFT + STORE + 0}.
2. Press the \texttt{MODE/TRG} softkey to enter the Mode/Trigger screen.
3. Move the entry focus to \texttt{PULSES} and select \texttt{PATTERN}.
4. Move to \texttt{PULSES OUT 1} and select \texttt{NRZ}.
5. Move to \texttt{OUT 2} and select \texttt{RZ}.
6. Set the \texttt{PRBS POLYNOM} to \(2^{15} - 1\).
7. Set \texttt{TRIGGER OUTPUT AT:} to \texttt{SEGM2 START}.

<table>
<thead>
<tr>
<th>CONTINUOUS PATTERN of</th>

---

52
Getting Started
Setting Up a Serial Data Sequence

To set the **timing parameters** as required:

1. Press the **TIMING** softkey to enter the Timing menu.
2. Switch on both outputs.
3. Enter a period of 6 NS.
4. Enter a **WIDTH** of 3 NS for output 2.

![Timing Parameters Table]

**NOTE**

You cannot enter a pulse width for output 1 because of the NRZ setting. This is indicated by the dashes in the **WIDTH** entry field.

To set the **level parameters** as required:

1. Press the **LEVELS** softkey to enter the Level menu.
2. Select **SET TTL** for both outputs.
Getting Started
Setting Up a Serial Data Sequence

To set the **data pattern** as required:

1. Press the **PATTERN** softkey to enter the Pattern menu.
2. Move to **UPDATE** and select **NO UPDATE**. This speeds up data setting.
3. Set the length of Segment 1 to 16 (header).
4. Set the length of Segment 2 to 32 (payload data).
5. Set the length of Segment 3 to 16 (trailing pause).

**NOTE**
The frequency of 166.7 MHz requires a segment length resolution of 8. See “Segment/Length/Loop Control Table” on page 81. Therefore, the lengths of the segments must be set to be multiples of 8.
Getting Started
Setting Up a Serial Data Sequence

6 Move the entry focus to “1” in the SEGMENT column and press the
ENTER key to edit the segment.

7 Enter 1110101001101101 as channel 1 data.

8 Select LOW SEG for channel 2.

9 Move to the SEGMENT entry field and select segment 2.

10 Select PRBS for channel 1 to generate pseudo-random payload data.

11 Select HIGH SEG for channel 2 to generate the clock pulse.
12 Move to the Segment entry and select segment 3.

13 Select LOW for both channels.

<table>
<thead>
<tr>
<th>Segment 3</th>
<th>NO UPD</th>
<th>Address</th>
<th>Length</th>
<th>16</th>

3 Using the Agilent 81130A

This chapter provides complete reference information for using the Agilent 81130A by means of the user interface screens. Each screen is described in detail. To access the individual screens, use the softkeys below the screen. There are two softkey layouts:

- the default layout

```
| MODE/TRG | TIMING | LEVELS | PATTERN |
```

- the alternative layout displayed after pressing the MORE key

```
| LIMITS | TRG-LEV | MEMCARD | CONFIG |
```

At the end of this chapter, “Warnings and Errors” on page 96 provides details on the instrument’s warning and error messaging system.

**NOTE**
For general information on using the Agilent 81130A and information on the instrument’s hardkeys, please refer to Chapter 1 “Introducing the Agilent 81130A Pulse and Data Generator” on page 15.

**NOTE**
For information on using the Agilent 81130A via remote control, please refer to the Reference Guide, part number 81130-91021.
The Mode/Trigger Screen

This section describes the Mode/Trigger screen, starting with an overview of the available parameter combinations, followed by detailed descriptions of each combination.

Overview

To access the Mode/Trigger screen, press the MODE/TRG softkey.

The following figure shows a typical Mode/Trigger screen, where the individual parameters are indicated. The parameter combinations are listed in the table on the next page.

In this screen, you can start and stop the instrument and set up the signal to be continuous, started or gated and to be a pulse stream, a burst (several pulses followed by a pause) or a pattern.
Furthermore, you can specify the trigger input and the trigger output behavior.

The following table provides a list of possible parameter combinations. The rows refer to the numbers in the figure.

<table>
<thead>
<tr>
<th>Trigger Mode</th>
<th>Continuous</th>
<th>Started</th>
<th>Gated</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pulse Mode</strong></td>
<td>Pulses</td>
<td>Burst</td>
<td>Pattern</td>
</tr>
<tr>
<td><strong>Pulse</strong></td>
<td>2–65504</td>
<td>RZ</td>
<td>RZ</td>
</tr>
<tr>
<td><strong>PES</strong></td>
<td>Polynom/ Burst Period</td>
<td>2–65504 clocks</td>
<td>$2^7 - 1$</td>
</tr>
<tr>
<td><strong>Arming Source/ Triggered by</strong></td>
<td>MAN key Ext. Input</td>
<td>MAN key Ext. Input</td>
<td></td>
</tr>
<tr>
<td><strong>Trigger Out</strong></td>
<td>marks each pulse period</td>
<td>marks start of burst</td>
<td>marks each pulse period or start of segment 1–4</td>
</tr>
</tbody>
</table>

**Run/Stop Indicator**

In started and gated mode, the Run/Stop indicator shows the current function of the MAN key:

- if the indicator shows RUN, pressing the MAN key starts the instrument, that is: trigger/gate is armed
- if the indicator shows STOP, pressing the MAN key stops the instrument, that is: generating of the current signal is aborted and the trigger/gate is not armed
Pattern Formats

In pattern mode, the **pulse output format** of a pattern can be selected from RZ, R1, and NRZ. The timing of the different formats is shown in the diagram:

```
   1  1  1  0  0  1
RZ

   0  1  0  1
R1

   0  0  0  1
NRZ
```

**NOTE**

To generate DNRZ (Delayed NRZ) signals, program NRZ pulses with a delay. See “Pulse Delay Parameter” on page 74.

Random Pattern

To generate **random data**, PRBS (Pseudo Random Binary Sequence) can be selected as a pulse type. To determine the repetition length of the PRBS sequence, specify the parameter \( n \) of the PRBS Polynom \( 2^n - 1 \). The value range is 7 to 15. This allows to specify repetition lengths between \( 2^7 - 1 = 127 \) and \( 2^{15} - 1 = 32767 \).

The sequence is stored in the memory. This reduces the available memory for data patterns.

**NOTE**

The instrument always cycles completely through the PRBS sequence. When used multiple times or by different segments, the sequence is not restarted at the beginning of another segment’s execution.
Continuous Pulses Mode

The following figure shows typical timings for trigger mode CONTINUOUS and pulse mode PULSES.

- Pulse periods are generated continuously.
- TRIGGER OUT marks each pulse period.
Using the Agilent 81130A
The Mode/Trigger Screen

Continuous Burst Mode

The following figure shows typical timings for trigger mode CONTINUOUS and pulse mode BURST.

Characteristics

- A burst of pulse periods is repeated continuously.
- You can select the burst periods (total of pulse periods per burst) in the range of 2–65504.
- You can select the number of pulses per burst in the range of 2–65504 up to the burst period.
- TRIGGER OUT marks each start of a burst.
Continuous Pattern Mode

The following figure shows typical timings for trigger mode CONTINUOUS and pulse mode PATTERN.

Characteristics

- A pattern of pulses is repeated continuously.
- You can select between RZ, R1 and NRZ data pulses for each output.
- In the pattern screen (see “The Pattern Screen” on page 79) you can
  - select the pattern length and the data values for each output
  - divide your pattern into individual, repeatable segments.
- You can select TRIGGER OUT to mark each pulse period, or the start of a selected segment.
Using the Agilent 81130A
The Mode/Trigger Screen

**Started Pulses Mode**

The following figure shows typical timings for trigger mode STARTED and pulse mode PULSES. The pulses are triggered by the rising edge of the arming source.

Characteristics

- Pulse periods are triggered by (TRG'D BY) an active edge at the selected arming source:
  - **MAN** key on front panel, triggered by pressing or releasing.
  - **EXT INPUT** triggered by rising or falling edges.
- **TRIGGER OUT** marks each pulse period.

**NOTE**

For the delay between trigger in to output refer to *Agilent 81130A Reference Guide, Chapter 3 “Specifications”*. 

![Diagram](image-url)
Started Burst Mode

The following figure shows a typical timing for trigger mode STARTED and pulse mode BURST. The bursts are triggered by the rising edge of the arming source.

Characteristics

- A burst of pulse periods is triggered by an active edge at the selected arming source
  - MAN key on front panel, triggered by pressing or releasing.
  - EXT INPUT triggered by rising or falling edges.
- You can select the burst periods (total of pulse periods per burst) in the range of 2–65504.
- You can select the number of pulses per burst in the range of 2–65504 up to the burst period.
- TRIGGER OUT marks each start of a burst.
Starting Pattern Mode

The following figure shows typical timings for trigger mode STARTED and pulse mode PATTERN. The patterns are triggered by the rising edge of the arming source.

The pattern is repeated only if it is embedded in a loop.

**Characteristics**

- A pattern of pulses is triggered by an active edge at the selected arming source
  - MAN key on front panel, triggered by pressing or releasing.
  - EXT INPUT triggered by rising or falling edges.
- You can select between RZ, R1 and NRZ data pulses for each output.
- In the pattern screen (see “The Pattern Screen” on page 79) you can
  - select the pattern length and the data values for each output
  - divide your pattern into individual, repeatable segments.
- You can select TRIGGER OUT to mark each pulse period or the start of a selected segment.
Gated Pulses Mode

The following figures show typical timings for trigger mode GATED and pulse mode PULSES.

Characteristics

- Pulse periods are gated by (enabled by) an active level at the selected arming source:
  - MAN key on the front panel, gated while pressed.
  - EXT INPUT (external signal) gated by high or low.
- TRIGGER OUT marks each pulse period.
Gated Burst Mode

The following figure shows typical timings for trigger mode GATED and pulse mode BURST.

Characteristics

- Bursts of pulse periods are gated by (enabled by) an active level at the selected arming source:
  - MAN key on the front panel, gated while pressed or released.
  - EXT INPUT (external signal) gated by high or low.
- You can select the burst periods (total of pulse periods per burst) in the range of 2–65504.
- You can select the number of pulses per burst in the range of 2–65504 up to the burst period.
- TRIGGER OUT marks each start of a burst.

**NOTE**

When the gate signal is deasserted, the burst generation will be interrupted immediately and resume with the next phase after the gate signal is asserted again.
Gated Pattern Mode

The following figure shows typical timings for trigger mode GATED and pulse mode PATTERN.

Characteristics

- A pattern of pulses is gated by an active level at the selected arming source
  - MAN key on front panel, gated while pressed or released
  - EXT INPUT (external signal) gated by high or low.
- You can select between RZ, R1 and NRZ data pulses for each output.
- In the pattern screen (see “The Pattern Screen” on page 79) you can
  - select the pattern length and the data values for each output
  - divide your pattern into individual, repeatable segments.
- You can select Trigger out to mark each pulse period or the start of a segment.

NOTE

When the external gate signal is deasserted, the pattern generation will be interrupted immediately and resume with the next phase after the gate signal is asserted again (with the MAN key, pattern generation will always start from the beginning).
The Timing Screen

To access the Timing screen press the TIMING softkey.

You can use the left part of the Timing screen to view and control the pulse timing parameters of channel 1, the right part for those of channel 2.

The individual timing parameters are described in more detail in the following. Parameters can be entered in different formats. The LEADE and TRAIE parameters are available with the AGILENT 81131A output module only.

If you prefer to set the timing parameters per output together with the level parameters of that output, switch the type of parameter grouping. See “Parameter Grouping” on page 93.

**NOTE**

If only one channel is installed, Timing and Levels screens are grouped in an Output screen automatically.
When you press SHIFT + MORE (GRAPH) or the TIMING softkey again, you will see a graphical representation of the timing parameters of both channels. The currently selected parameter is displayed in the Modify/Enter area and is indicated by dashed or bold lines in the graphical display.

Use the left/right cursor keys to move to an individual timing parameter.

**NOTE**

Note that in graphics mode you can only adjust the values of each parameter, not the parameter format. If you want to change the format of a parameter, for example WIDTH to DTYCYC, you must be in text mode to select the parameter name with the cursor.

Press SHIFT + MORE (GRAPH) or the TIMING softkey again to toggle between textual and graphical display.
Using the Agilent 81130A
The Timing Screen

Output ON/OFF Parameter
Switch on and off the normal output and the inverted output of each channel.

**NOTE**
If a channel is switched on, this also activates the internal error check to detect parameter conflicts.

1  **OFF** ← normal ← **OFF**  2
1    ← inverted ←  2

You can use short cuts as described in "Switching the Outputs On and Off" on page 27.

Pulse Period Parameter
Set the pulse period as either **PERIOD** or **FREQUENCY**.

Pulse Delay Parameter
Set the delay of the leading edge within the pulse period. There are three delay formats available:

- **DELAY** (select **ABSOLUTE**)
  
  **DELAY** is the absolute delay from the start of a pulse period to the start of the leading edge of the pulse.

- **DELAY**% (select **% OF PERIOD**)
  
  The delay from the start of the pulse period to the start of the leading edge expressed as a percentage of the pulse period.

- **PHASE** (select **PHASE**)
  
  The phase delay in degrees from the start of the pulse period to the start of the leading edge (360° = 1 pulse period).
Using the Agilent 81130A
The Timing Screen

**Pulse Width Parameter**

Set the width of the output pulse. There are three width formats available:

- **WIDTH (select WIDTH)**
  The absolute pulse width measured from the start of the leading edge to the start of the trailing edge. In this format, the pulse width is independent of changes in pulse period and delay.

- **DUTYCYC (select DUTYCYCLE)**
  The duty cycle is the pulse width measured from the start of the leading edge to the start of the trailing edge expressed as a percentage of the period. In this format, if you adjust the period, the absolute width is adjusted to maintain the duty cycle.

- **TRAILDEL (select TRAILDEL)**
  The trailing delay is the absolute delay from the start of the pulse-period to the start of the trailing edge. In this format the trailing edge remains fixed relative to the start of the pulse period if you adjust the pulse delay (leading edge delay) or the pulse period.

**Leading Edge/Trailing Edge Parameter**

This parameter is available only with the AGILENT 81131A output module.

Select between two different values of the transition time of the pulse.

- **LEADE**
  Set the transition time to 0.8 or 1.60 ns.

- **TRAIL**
  The trailing edge is always the same as the leading edge.
The Levels Screen

To access the Levels screen press the LEVELS softkey.

You can use the left part of the Levels screen to view and control the level parameters of channel 1, the right part for those of channel 2, and you can select to add the channels.

When you press SHIFT + MORE (GRAPH) or the LEVELS softkey, you will see a graphical representation of the level parameters. The currently selected parameter is displayed in the Modify/Enter area and is indicated in the graphical display.

When output limits are on, the limits are indicated on the Levels screen in graphics mode (see “The Limits Screen” on page 86).
If you prefer to set the level parameters per output together with the timing parameters of that output, switch the type of parameter grouping. See “Parameter Grouping” on page 93.

**NOTE**

If only one channel is installed, Timing and Levels screens are grouped in an Output screen automatically.

**NOTE**

Note that in graphics mode you can only adjust the values of each parameter, not the parameter format. If you want to change the format of a parameter, for example OFFS-AMPL to HIGH-LOW, you must be in text mode to select the parameter name with the cursor.

**NOTE**

When the output is switched on, the instrument monitors the actual voltage and current levels at the output. The output is automatically switched off if voltage levels or power dissipation reach levels that could damage the output circuits.

**Separate Outputs/Digital Add Parameter**

Select the outputs of channel 1 and 2 to be separate or digitally added (available only in text mode):

- **SEPARATE OUTPUTS** (select SEPARATE)
  Output 1 and 2 operate as entirely separate outputs.

- **DIGITAL ADD AT OUT1** (select DIG. ADD)
  Channel 1 and 2 are added (XOR-combined). The resulting signal is available at the output 1 connector. Use this to build complex pulse waveforms. Channel 2 is still available.

**NOTE**

The channel add option is available if the AGILENT 81130A is equipped with an additional output module AGILENT 81131A or AGILENT 81132A.
Offset/Amplitude, High/Low Level Parameters

Set and display the pulse levels in terms of either offset and amplitude, or high and low level. You can quickly set TTL or ECL output levels using the SET TTL and SET ECL formats.

- **SET TTL**
  Set the levels to the default TTL levels automatically:
  - TTL-HI: +2.50 V
  - TTL-LOW: +0.0 mV
  The default levels are set once and can be adjusted afterwards by moving the entry focus to the values as normal.

- **HIGH-LOW**
  Select high and low level format for the pulse levels.

- **OFFS-AMPL**
  Select offset and amplitude format for the pulse levels. Offset is measured from 0V to the middle of the pulse amplitude. Pulse amplitude is the difference between the high and low levels of the pulse.

- **SET ECL**
  Set the levels to the default ECL levels automatically:
  - ECL-HI: -850 mV
  - ECL-LOW: -1.80 V
  These default levels are set once and can be adjusted afterwards by moving the entry focus to the value as normal.

Voltage/Current Mode (mV/V/mA/A)

Move the entry focus onto the level units to select between setting the pulse levels IN VOLTS or IN AMPERES.

**NOTE**

This parameter is only available in text mode.
The Pattern Screen

Use the Pattern screen to set up a pattern sequence to be generated by the instrument.

To access the Pattern screen, press the PATTERN softkey.

The pattern sequence can consist of up to 4 individual segments of a specific length. Each segment contains the data for channel 1 and 2.

In gated and in started mode you can select to execute the sequence only once or to jump back to a segment of your choice at the end of the sequence (resume indicator).

You can build loops by specifying:

- the loop start segment (loop indicator)
- the length of the loop, that is the total of segments in the loop (loop indicator)
- the loop count, that is how often the loop is executed.
Using the Agilent 81130A
The Pattern Screen

Update Parameter
Select to update the hardware after each of your changes in the screen or only on demand.

- **UPDATE (select UPDATE)**
  The hardware is updated automatically after each change. Changes will affect the output signal immediately.

- **NO UPD (select NO UPDATE)**
  The hardware is not updated automatically. For faster editing, complete your programming before you update the hardware, then move the entry focus to NO UPD and press the ENTER key.

Resume Indicator
This indicator is only available in gated and started mode. Specify how the sequence is to be executed.

- **RUN ONCE**
  The sequence is executed only once.

- **JUMP TO SEGMENT 1 ... 4 (select JMPTO SEG1 ... JMPTO SEG4)**
  Select a segment with which the instrument should resume after the last segment of the sequence has been executed.
Segment/Length/Loop Control Table

The parameters in this table control the segment and loop parameters. You can move the entry focus to any cell of the table.

- SEGMENT column
  Select a segment to edit. Press ENTER to invoke the segment editor.
  See “The Segment Editor” on page 83.

- LENGTH column
  Adjust the length of the segment.
  The maximum length of all segments is 65504 per channel. If PRBS data is used, this value is reduced by the repetition length as given by the PRBS Polynom parameter.

**NOTE**

Reducing the length of a programmed segment results in the loss of as many bits as the segment length is reduced, even if the length is raised again later.

The **segment length resolution**, that is the steps in which you can set the segment length, depends on the required data rate:

<table>
<thead>
<tr>
<th>Resolution</th>
<th>Maximum Data Rate in MBit/s</th>
<th>Period in ns</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>41.67</td>
<td>24.00 ... max. period</td>
</tr>
<tr>
<td>2</td>
<td>83.33</td>
<td>12.00 ... 23.99</td>
</tr>
<tr>
<td>4</td>
<td>166.7</td>
<td>6.000 ... 11.99</td>
</tr>
<tr>
<td>8</td>
<td>333.3</td>
<td>3.000 ... 5.999</td>
</tr>
<tr>
<td>16</td>
<td>666.7</td>
<td>1.500 ... 2.999</td>
</tr>
</tbody>
</table>

*Example:*  
If a data rate of 300 MBit/s is required, each segment length must be a multiple of 8 (8, 16, 24, 32, ...).
• Loop indicator
  Use the loop indicator to specify the start segment and the length of the loop. Move the entry focus to the indicator, select
  – LOOPSTART to specify the start segment of the loop and press the ENTER key.
  
  Choose from SEGMENT 1 ... SEGMENT 4 and press the ENTER key again.
  – LOOPLENGT to specify the length of the loop and press the ENTER key.
  
  Choose from 1 SEGMENT ... 4 SEGMENT and press the ENTER key again.

• LOOPCNT column
  In the Loopcount column, specify how often the loop is to be executed (maximum loopcount is $2^{20}$).

**NOTE**

If counted loops (loop counter, loop indicator) are used, the minimum length for the first segment is required to be twice the segment length resolution.

If only an infinite loop (resume indicator, continuous mode) is used, the sum of all used segment lengths is required to be twice the segment length resolution.
The Segment Editor

Use the segment editor to set up a data segment for the pattern sequence.

To edit a segment, select the segment in the Segment column of the Pattern screen and press the ENTER key.

The parameters Segment, Update, and Length refer to the corresponding entries in the Pattern screen.

The CH1 and CH2 rows contain the bits of the data patterns for channel 1 and channel 2. The BOTH row allows to edit both channels together by entering the decimal equivalent:

<table>
<thead>
<tr>
<th></th>
<th>Value 1</th>
<th>Value 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>CH1</td>
<td>00000000</td>
<td>00000000</td>
</tr>
<tr>
<td>CH2</td>
<td>00000000</td>
<td>00000000</td>
</tr>
<tr>
<td>BOTH</td>
<td>00000000</td>
<td>00000000</td>
</tr>
</tbody>
</table>

When you press \( \text{SHIFT} + \text{MORE (GRAPH)} \), you will see a graphical representation of the data. This is especially helpful when viewing and editing NRZ data.

Address Parameter

The current bit address in the segment is displayed. Use the knob to scroll through the data or enter a value to move to a particular address.
**Data Type Parameter**

Select a data type per channel. It is displayed next to the CH1 and CH2 column.

- **DATA**
  This allows you to enter the bits of your sequence manually or by using block editing functions. See “Block Editing Functions” on page 85.

- **HIGH, LOW**
  Set all bits to high or low.

- **PRBS**
  Set all bits to be generated pseudo-randomly.
  The following rules apply when PRBS data is used:
  - in the same segment, the data type of the other channel must be high, low, or PRBS
  - over all segments, PRBS must only be used in combination with the same data type

  **Example:**
  The following table shows an example of how the PRBS data type may be combined in a pattern sequence of 4 segments:

<table>
<thead>
<tr>
<th>Channel 1</th>
<th>Segment 1</th>
<th>Segment 2</th>
<th>Segment 3</th>
<th>Segment 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel 2</td>
<td>Low</td>
<td>High</td>
<td>Data</td>
<td>High</td>
</tr>
<tr>
<td>Channel 1</td>
<td>Data</td>
<td>PRBS</td>
<td>Data</td>
<td>PRBS</td>
</tr>
</tbody>
</table>

**NOTE**

Specify the repetition length of the pseudo-random data sequence in the Mode/Trigger screen. See “The Mode/Trigger Screen” on page 60.
Block Editing Functions

The block editing functions can help when entering bit patterns.
Move the entry focus onto the CH1, CH2, or BOTH at the left hand side of the screen. Select from the following options and press ENTER.

- **FILL 0, FILL 1**
  Set all bits from the current position to the end of the sequence to 0 or 1.

- **INVERT**
  Invert all bits from the current position to the end of the sequence.

- **FIRST BIT**
  Set the first bit to 1, and all following bits to 0.

- **LAST BIT**
  Set the last bit to 1, and all preceding bits to 0.

- **INS BIT**
  Insert a bit at the current position. The bit value is copied from the current bit, all subsequent bits are shifted right. The last bit is lost.

- **DEL BIT**
  Delete the bit at the current position. All subsequent bits are shifted left. The new last bit of the sequence is copied from the old last bit.

- **CLOCK\(\div n\)**
  Fill the bits from the current position to the last with a divided clock pattern. After pressing ENTER you can adjust the dividing factor \(n\) from 2 to 32768 and press ENTER again.

The bit sequence will be set up as follows:

<table>
<thead>
<tr>
<th>(n)</th>
<th>Sequence</th>
<th>(n)</th>
<th>Sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>101010101010101...</td>
<td>6</td>
<td>111000111000111...</td>
</tr>
<tr>
<td>3</td>
<td>100100100100100...</td>
<td>7</td>
<td>111000011100001...</td>
</tr>
<tr>
<td>4</td>
<td>110011001100110...</td>
<td>8</td>
<td>11110001111000...</td>
</tr>
<tr>
<td>5</td>
<td>110001100011000...</td>
<td>9</td>
<td>111100001111000...</td>
</tr>
</tbody>
</table>
The Limits Screen

Use the Limits screen to set up voltage and current limits for the pulse level parameters to prevent accidental damage of the device under test.

To access the Limit screen press the LIMITS softkey. If the softkey is not displayed, press MORE.

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low-V</td>
<td>-500mV</td>
</tr>
<tr>
<td>High-V</td>
<td>+500mV</td>
</tr>
<tr>
<td>Low-A</td>
<td>-10.0mA</td>
</tr>
<tr>
<td>High-A</td>
<td>+10.0mA</td>
</tr>
</tbody>
</table>

After you switch on the limits, the pulse level parameters on the Levels screen cannot be adjusted outside the ranges specified on the Limits screen if the output is switched on.

The limits are displayed in the Level screen in graphics mode.
The Trigger-Level Screen

Use the Trigger-Level screen to

- set the termination voltage and the triggering threshold for the EXT INPUT connector
- set the termination voltage for the CLK/REF INPUT connector
- set the output termination and levels for the TRIGGER OUT connector.

To access the Trigger-Level screen, press the TRG-LEV softkey. If the softkey is not displayed, press MORE.
External Input Connector
Select a termination voltage and a threshold for the external input connector (EXT-IN). Press the ENTER key to complete.

- **VARIABLE**
  Move the entry focus to the voltage fields and enter the termination voltage and the threshold in the range of –2.1 V to +3.3 V.

- **SET TTL, SET ECL, SET PECL**
  The termination voltage and termination are adjusted according to the selected technology.
  These default values are set once and can be adjusted afterwards by moving the entry focus to the value as usual.

Clock Input Connector
Select a termination voltage clock input connector (CLK-IN). Press the ENTER key to complete.

- **VARIABLE**
  Move the entry focus to the voltage field and enter the termination voltage in the range of –2.1 V to +3.3 V.

- **SET TTL, SET ECL, SET PECL**
  The termination voltage is adjusted according to the selected technology.
  These default values are set once and can be adjusted afterwards by moving the entry focus to the value as usual.

Trigger Out Connector
Select an output level and termination according to the technology used at the trigger output (TR-OUT).
The Memory Card Screen

Use the Memory Card screen to

• store instrument settings to the memory card,
• recall instrument settings from the memory card,
• delete files from the memory card,
• format a memory card.

To access the Memory Card screen, press the MEMCARD softkey. If the softkey is not displayed, press MORE.

Directory Path Parameter

Move the entry focus to DIR PATH to change the directory on the memory card, or to view the sub-directories of the current directory (the name of the current directory is displayed next to DIR PATH).

All sub-directories of the current directory are listed in the Modify/Enter area.

To change the directory, turn the knob to select the directory name and press the ENTER key.

Note that when you are in a sub-directory you can return to the parent-directory by selecting “..” from the directory list.
Filename Parameter

Move the entry focus to the FILENAME parameter to select a file from the current directory. Use the knob to scroll through the filenames listed in the Modify/Enter area.

Memory Card Operations

Move the entry focus to PERFORM OPERATION and use the knob to select the required operation. Press the ENTER key to perform the operation.

- **READCARD**
  Read the DOS file system information from the memory card after inserting a new card.

- **RECALL**
  Recall the selected file as the current instrument setting.

- **STORE**
  Store the current instrument setting to the memory card.
  Press ENTER once to start editing the filename for the setting in the Modify/Enter area. The currently selected filename is used as default.

**CAUTION**

If you do not modify the filename, the existing file will be overwritten when you press ENTER.

To modify the filename, move the character cursor with the cursor keys. Modify a character using the knob. When you have finished, press ENTER to store the setting.

The filename can be up to 8 characters long.

Press the cursor up or cursor down keys to cancel the store operation at any time.

Note that the DOS filename suffix “.ST0” is added automatically to the filename when you store the current settings.
• **STORE ALL**
  Store the current instrument setting and the instrument setting memories 1 to 4 to the memory card. Each setting is stored in a separate file with the same name but different suffixes (".ST0" for the current setting, ".ST1" to ".ST4" for setting memories 1 to 4).
  Press ENTER once to start editing the filename for the setting in the Modify/Enter area. The currently selected filename is used as default.

**CAUTION**
If you do not modify the filename, the existing file will be overwritten when you press ENTER.

To modify the filename, move the character cursor with the cursor keys. Modify a character using the knob. When you have finished, press ENTER to store the setting.

The filename can be up to 8 characters long.

Press the cursor up or cursor down keys to cancel the store operation at any time.

• **DELETE**
  Delete the selected file from the memory card.

• **FORMAT**
  Format the memory card.

**CAUTION**
Formatting a memory card destroys any existing files on the card.
The Configuration Screen

Use the Configuration screen to:

• set the GP-IB address of the Agilent 81130A
• initiate instrument selftests
• group parameters by timing/levels or by output 1/2
• select the pulse period source
• select the frequency reference source for the PLL
• compensate for delays between channel 1 and 2 by deskewing

To access the Configuration screen, press the CONFIG softkey. If the softkey is not displayed, press MORE.

GP-IB Address

Set the GP-IB address for the instrument in the range of 0 to 30. The default address is 10.
Perform Operation Selftest

Move the entry focus to **PERFORM: SELFTEST**, select the test type, and press the **ENTER** key.

- **µP BOARD**
  Perform a selftest on the microprocessor board of the Agilent 81130A.

- **SIGNAL**
  Perform a selftest on the timing and output modules of the Agilent 81130A.

- **µPROCESSOR AND SIGNAL (select BOTH)**
  Perform both selftests.

If the selftests fail, a flashing E is displayed. Press **HELP** to see the list of error messages.

Parameter Grouping

The timing and level parameters of both outputs 1 and 2 can be displayed in separate screens either grouped by parameter types (timing/level), or by output.

Move the entry focus to **GROUP PARAMS BY:** and select between

- **TIMING/LEVELS**
- **OUTPUT1/2**

For descriptions of the screens, refer to “The Timing Screen” on page 72, “The Levels Screen” on page 76 or “The Output Screens” on page 95.

**NOTE**

If only one channel is installed, Timing and Levels screens are grouped in an Output screen automatically.
Using the Agilent 81130A
The Configuration Screen

**Pulse Period Source**
The instrument provides an internal PLL to generate the pulse period. However, you can use an external clock source applied to the CLK/REF INPUT connector instead.

- **INTERNAL PLL**
  Internal PLL is used for pulse period generation.

- **CLK-IN**
  External clock source is used for pulse period generation.

**NOTE**
The externally applied clock signal is measured once when CLK-IN is selected. During the measurement, the instrument cannot generate pulses.

If the external frequency is changed without re-measuring, all timing parameters become invalid. To update the measurement, select **MEASURE ONCE** in the Period/Frequency entry field of the Timing screen and press the **ENTER** key.

**PLL Reference**
Set the frequency reference source for the PLL:

- **INTERNAL**
  An internal signal is used as reference.

- **CLK-IN**
  An external reference signal at the CLOCK/REF INPUT connector is used. The frequency must be 1, 2, 5, or 10 MHz.

**NOTE**
The PLL reference parameter is available only if **INTERNAL PLL** is selected as **PULSE-PERIOD** parameter.

**Deskew Parameter**
Set the deskew of output 1 and 2 in the range of \( \pm 25.05 \) ns to compensate for different cable delays.
The Output Screens

If two channels are installed, the Output screens show both, timing and level parameters combined on one screen for output 1 and one screen for output 2. To make the Output screens available, the parameter GROUP PARAMS BY: must be set to OUT 1/2 in the Configuration screen (see “The Configuration Screen” on page 92).

To access an Output screen, press the OUTPUT1 or OUTPUT2 softkey.

**NOTE**

If only one channel is installed, Timing and Levels screens are grouped in an Output screen automatically.
Warnings and Errors

The Agilent 81130A has two levels of error reporting called “warnings” and “errors”. Checking for errors and warnings is always enabled, unless you switch it off via the GP-IB using the :SYSTem:CHECK command or by switching off the output(s).

- A **warning** is generated when the output signal *could* be invalid due to a combination of worst case uncertainties at the current settings of all relevant parameters. For example, when adjusting the pulse width, all other timing parameters and their uncertainties have to be considered in order to check if the width setting will fit within the pulse period. Note that the warning limits are therefore not fixed for a particular parameter, but vary with the settings of the related parameters. It is also possible that the error and warning limits are the same, that is, a warning does not occur before the error limit is reached. If a warning occurs, the settings are still implemented in the hardware because the worst-case conditions used to evaluate the warning limits are very unlikely to occur in practice. A blinking W indicates that one or more warnings have occurred. Press HELP to view the warning list.

- An **error** is generated when an invalid mode is chosen, or the required parameter settings cannot be implemented in the output hardware. Multiple errors can occur, but only the first error detected is displayed. An error is indicated by a blinking error message at the bottom of the screen.

**NOTE**

If the output(s) are switched off and you are using the knob to adjust parameters, it is usually not possible to generate warnings or errors. All parameters are automatically limited to settings that guarantee specified operation.

However, if you press the SHIFT key while turning the knob, you can adjust a parameter beyond its warning limits. This requires the output(s) to be switched on.
NOTE

You can press SHIFT + HELP (AUTOSET) to carry out an autoset. The instrument resets all parameters, based on the current period setting, to remove all warning and error conditions.

An Example of Warning and Error Reporting

1 Switch on the instrument and recall the standard settings by pressing SHIFT + STORE (RECALL) + 0.
   The period is now set to 1 μs.
2 Switch on the output by pressing SHIFT + 0 (ON/OFF).
3 On the Timing screen, move the parameter cursor to the value of the WIDTH parameter (100NS).
4 Use the knob to make the pulse width as large as possible (998.5 NS).
   This limit is intended to guarantee that the actual output pulse is within specifications, for the actual period.
5 Press SHIFT and adjust the pulse width above its warning limit. A flashing W appears to indicate that a warning condition has occurred.

NOTE

Note that as long as no errors occur, the output hardware is set up and attempts to generate the required output.

6 Press HELP to see the warning message:
   WIDTH 1 TOO CLOSE TO PERIOD
7 Press HELP again to return to the WIDTH parameter.
8 Increase the pulse width further until a flashing error message appears (approximately 999.5 ns):
   OUTPUT 1: WIDTH > PERIOD
   You have reached the current upper error-limit of the WIDTH parameter.
   The setting is not possible with the hardware.
9 Press SHIFT + HELP to perform an AUTOSET.
Using the Agilent 81130A

Warnings and Errors
Installation & Maintenance
Initial Inspection

Inspect the shipping container for damage. If the container or cushioning material is damaged, keep it until the contents of the shipment have been checked for completeness and the instrument has been verified both mechanically and electrically.

**WARNING**

To avoid hazardous electric shock, do not perform electrical tests when there are signs of shipping damage to any part of the instrument's outer covers or panels.

If the contents are incomplete, or there is mechanical damage, or if the instrument does not work as expected within its specifications, notify the nearest Agilent office. (Please request the latest performance tests from Agilent Technologies.) Keep the shipping materials for inspection by the carrier. The Agilent office will arrange for repair or replacement without awaiting settlement.
Standard Deliverables

The Agilent 81130A shipping container contains the following standard deliverables:

1. The Agilent 81130A Pulse Generator.
3. A power cord.

1. Agilent 81130A Pulse/Pattern Generator

2. This Quick Start Guide and the Reference Guide

3. A Power Cord
Initial Inspection

Options and Accessories:

Options

- Agilent 81131A  400 MHz, 3.8 V Output module
- Agilent 81132A  660 MHz, 2.4 V Output module
- Agilent 15104A  Pulse Adder/Splitter
- Rear Panel Connectors  Option UN2
  - All inputs and outputs are at the rear panel
- 1 MB SRAM Memory Card  Option UFJ
  - (Agilent part number 0950-3380)

**NOTE**

You can only use one type of output module (Agilent 81131A or Agilent 81132A) per instrument.

The following figure shows the instrument's rear panel with Option UN2 installed.

![Rear Panel Connectors Option UN2](image)

Handle Accessory

- Front Handle Kit  Agilent part number 5063-9226

---

**Power Requirements**

---

**CAUTION**

Before applying AC line power to the instrument, ensure that the correct line fuse is installed in the fuse holder and the correct power cable is fitted.

---

**NOTE**

When the front panel switch is off, the instrument is in “standby” mode. The instrument is disconnected from the AC line power *only* by disconnecting the power cord. Please make sure that the power cord is easily identifiable and can quickly be reached by the operator.

The following symbol is close to the ‘Standby’ switch on the front panel of the instrument.

![Symbol]

The instrument can operate from any single-phase AC power source supplying 100–240 V in the frequency range from 50 to 60 Hz, or 100–120 V at 400 Hz. The maximum power consumption is 300 VA with all options installed. When the instrument is switched on the power supply adapts automatically to the applied AC power (Auto Selection) and monitors the AC power range during operation.
Power Requirements

Replacing the Fuse

1  Remove the power cord.

2  Unscrew the fuse cap at the rear of the instrument beside the power-inlet socket.

3  Replace the fuse with the equivalent part:

<table>
<thead>
<tr>
<th>Line Voltage</th>
<th>Fuse Type</th>
<th>Agilent Part Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>100–240 V~</td>
<td>T 10A, 250 V</td>
<td>2110-0720</td>
</tr>
</tbody>
</table>

4  Refit the fuse cap.
In accordance with international safety standards, this instrument is equipped with a three-wire power cable. The figure below shows the part numbers of the power cables available. When connected to an appropriate AC power receptacle, this cable grounds the instrument cabinet.
Ventilation Requirements

The instrument is fitted with three cooling fans. Make sure that there is adequate clearance of 80 mm at the rear and 25 mm at the top and bottom to ensure adequate air flow. If the air flow is restricted, the internal operating temperature will be higher, reducing the instrument's reliability or causing the instrument's thermal-protection circuits to automatically switch off the instrument.

**NOTE**

Do not cover the ventilation holes.

Thermal Protection

Overheating Detection

The instrument monitors its internal temperature. If the temperature exceeds approximately 80°C, the power supply is switched off. The instrument will switch on again if the temperature falls below approximately 77°C.

Fan Failure

If a fan is broken or prevented from operating by a blockage, the temperature will increase. When the temperature exceeds approximately 80°C the overheating detection switches off the instrument for safety reasons. For reliability it is recommended to send instruments with broken or defective fans immediately to Agilent Service for repair.
Battery

This instrument contains a lithium battery. Typical life time of the battery is about 5 years.

**NOTE**

Recycle or dispose used batteries according to local regulations. Or contact your Agilent representative for information on battery recycling.

The battery is replaceable. Replacement should only be carried out by qualified service personnel.

**NOTE**

There is a danger of explosion if the battery is incorrectly replaced.

The battery must be replaced with the same or equivalent battery type: A Lithium CR2477-N type battery.

The Agilent replacement part number is: 1420-0557.

The battery is protected against charging.

**CAUTION**

Do not crush, puncture, or incinerate the battery. Do not short the battery's external contacts.
Battery Replacement

NOTE

Disconnect the power cord from AC line voltage to avoid electrical shock.

1. Remove the bumper which is fitted to the front panel.
2. Remove the strips on the left and right side of the front panel.
3. Remove the front panel which is secured with two screws at each side.
4. Disconnect the flat cable which connects the front panel to the chassis.
5. On the right side of the chassis there is a cover secured with one screw. Remove this cover.
6. Now the battery can be removed from the battery holder. It is recommended to push the battery on the top, and to pull the battery on the bottom with one finger for easier removal.
7. Fit the new battery in the holder, take care to not short current the battery on the chassis.
8. Fit the cover again and secure it with the screw to the chassis.
9. Re-connect the flat cable of the front panel again to the chassis connector. Make sure that the pin one (red wire) is pointing to the mid of the chassis.
10. Re-assemble the front cover.
11. Fit the strips to the sides of the front panel, again.
12. Fit the bumper to the front panel.
WARNING

The instrument is not designed for outdoor use. Do not expose the instrument to rain or other excessive moisture. Protect the instrument from humidity and temperature changes which could cause condensation within the instrument.

Do not operate the instrument in the presence of flammable gases, fumes or powders. Operation of any electrical instrument in such an environment constitutes a definite safety hazard.
Cleaning Recommendation

**WARNING**
To prevent electrical shock, disconnect the instrument from mains before cleaning. Use a dry cloth or one slightly dampened with water to clean external case parts. Do not attempt to clean internally.
Acoustic Noise Emission

For ambient temperatures up to 30°C, under normal operation and at the typical operator position:

\[ L_{pA} = 52 \text{ dBA} \]

Measured in accordance with ISO 7779 / EN 27779.

Geräuschemissionswerte

Bei einer Umgebungstemperatur bis 30°C
\[ L_{pA} = 52 \text{ dBA} \]
am Arbeitsplatz, normaler Betrieb.

Angabe ist das Ergebnis einer Typprüfung nach ISO 7779 / EN 27779.
